Client Testimonials

"Miura met our needs in terms of energy savings, on-demand steam, low emissions, and a smaller footprint. We have saved on our gas bill dramatically with our Miura boiler. In the year and a half since we've had it installed it has probably already paid for itself in energy savings. We've been able to increase production by a third while reducing our energy costs to less than what they were prior to installing this boiler. The Miura LX-100 has been a great asset for us and I would recommend it to anyone."

Kevin Wheeler, Director of Operations,
Highland Brewing Company

"Without our boiler this brewery stops. Reliability is what's important to us. MOM and Miura's Colormetry feature enable us to be hands off. It also gives us the peace-of-mind that Miura has our back on one of the most important pieces of equipment we have. It's also good to know that you're using something environmentally friendly and efficient. Add the advantages of ion-demand steam generation and a small footprint, and Miura is second-to-none in my mind."

Scott Vaccaro, Owner,
Captain Lawrence Brewing Company

MORE REASONS TO CHOOSE MIURA BOILERS

SPACE SAVINGS

Space is often at a premium for smaller breweries and distilleries, which is why they often have to get creative when designing their boiler room. This makes it imperative to have a small, compact boiler that can get the job done without taking up a lot of space. This is one of the reasons you should opt for a boiler that has a small footprint. Doing so means you will have room if you need to add another boiler down the road as your business grows.

Miura boilers are a great choice due to its compact, modular design, if you're looking to maximize physical space. And when it comes to steam production, you get the same output compared to larger boilers that take up much more space.

BL MICRO CONTROLLER

Green (Normal)

Yellow (Warning)

Red (Emergency)

Miura Boilers feature easy one-button start-up and a user-friendly interface for smooth operation, making Miura some of the most user-friendly boilers. With a one-button start operation, Miura provides a boiler control interface with the use of a simple selector wheel and LCD screen, known as the BL Controller. This interface allows smooth navigation through the boiler's control panel to access real-time data, change settings, view cautions or alarms, and more.

The BL Micro Controller is a smart monitoring and controls system for our steam boilers that helps identify and solve small problems before they turn into large ones. A microprocessor and interface built into every Miura Boiler we sell, this controller measures and monitor key metrics at multiple points in the system. It is an advanced diagnostic system, when a caution or alarm occurs the BL Micro Controller can identify it, pinpoint the source of the problem and recommend a solution on an LCD display.

With the seamless integration into other Miura boiler products, the BL Controller is fast becoming a staple of a clean, energy-saving boiler control system. Allowing connections into all aspects of boiler maintenance, the BL Controller takes advantage of Miura's modular design and provides a single access point for monitoring all round boiler performance.

SUPPORT PRODUCTS

BP Panel

MIURA's BP-201 is the core of the boiler room and is both a central monitor for all MIURA equipment and a multiple installation (MI) system controller allowing connected boilers to operate as a coordinated unit to meet fluctuating steam demand while optimizing efficiency, response time, and boiler longevity.

Ancillary Equipments

Colormetry Water Hardness System

Water Softener

Water Treatment Chemicals

WHY CHOOSE MIURA FOR YOUR BREWERY OR DISTILLERY?

Boilers are essential in the brewing and distilling process and Miura Boilers is the perfect boiler for breweries and distilleries as it creates high quality consistent steam that impacts the brewing and distilling process, it is also commonly used to sanitize and sterilize equipment.

One of the most important features to consider is the fast start-up time, our boilers can produce full steam from a cold start in a matter of minutes. This leads you to early production time, less wasted energy, more savings, and lower emissions for a reduced environmental impact.

In most cases, space is limited in breweries/distilleries, many of our boilers are so compact that they can fit through a standard doorway. Although smaller in physical size our exclusive technology produces BHP outputs comparable to larger units. Our modular design is fully scalable and can grow with your future steam demands.

We have a team of experts who can help you with your facility needs from planning to sales and support.
